

OPEN HUMAN · THE MEMORY LAYER

One memory of you.

Our long-term vision is the perfect user memory system: one that any AI agent or LLM product can connect to, to offer the best personalization possible.

A VISION, NOT A FEATURE LIST

HOW AI KNOWS YOU TODAY

AI learns about you in three ways.

01 INTERACTIONS

What you tell it

Your conversations with ChatGPT or any assistant, whenever you open it for something.

02 AGENT LEARNING

What it learns

The agent's own learning from its successes and failures.

03 CONNECTORS

What your tools hold

Gmail, Workspace, calendars and files: your digital world, through connectors.

Only one of these comes from your world.

NEED-BASED DATA

Two of the three are about the AI, not you.

Interactions and the agent's learning exist only because the AI has become part of your life. They're about the system and how it should perform, and they arrive on a need basis.

NEED-BASED

Interactions and learning

Gathered when you open the AI because you need something. Shaped by the task, not by your day.

NATURAL

Connector data

The only one of the three that comes naturally from your world.

What's missing is the part of your world you never hand over.

Your own mind.

Your own thoughts, your journals, the things you read and learn. It's a natural part of your world, and today's AI systems don't capture it.

Not impossible

It could be captured. Nobody has made it easy.

Friction

You'd have to think things through, brainstorm on purpose, or upload notes with no task in mind.

No reason

Most people never find a need that makes it worth doing.

WHERE MINDSPACE COMES IN

Capture the fourth kind, naturally.

01 JOURNAL

Think it down

Journal and take notes as you go, without a task in mind.

02 CAPTURE

Keep what you meet

Meetings, screenshots and things you read, each kept with your thought about it.

03 ONE PLACE

All of your day

Everything kept together, not spread across apps.

*We don't only learn about you when you talk to us.
We learn about you every day.*

WHY PEOPLE WILL USE IT

Utility first: learning on top of your memory.

People won't journal because we ask them to. Mindspace has to be more useful than anything else they could keep their notes in.

01 RETRIEVE

Ask your footprint

Search and ask across everything you've kept about your day.

02 REKINDLE

Relearn

Bring back what you learned and started to forget.

03 REMEMBER YOUR WAY

The recall dial

Choose how much help you want when you're trying to remember.

HOW IT ADDS UP

Four kinds of data. We hold the missing one.

CONNECTORS

Already open

Available through APIs to anyone who builds.

INTERACTIONS

Come with the product

Once people use Mindspace, we have these too.

YOUR MIND

Only we capture it

Journals, thoughts and learning, kept because they're useful to you.

Proactive assistants share the same memory underneath. We take the same route from a different need, journaling, so the memory starts out richer.
